

Exercise 1: Create a File **ClassForm.php**

Create a class named **Form** that allows you to create an HTML form, like :

```
<form>
  <fieldset>
    <legend>Login:</legend>
    Username: <input type="text"><br><br>
    Password: <input type="text"><br><br>
              <input type="submit" value="Login"><br><br>
  </fieldset>
</form>
```

The **constructor** must create the header code of the form using the < form> and < fieldset>tags .

Method setText () allows to add textbox, using < input> tag

Method setSubmit () allows to add submit button with < input> tag

The parameters of these methods must match the attributes of the corresponding HTML elements.

The method **GetForm ()** should return all the HTML code to create the form.

In the Main file **main.php**, you have to include your **classForm.php** file and create objects form, and add two zones text and a submit button Test the obtained display.
